Cloudflare for Government
Protect agency employees and improve citizen services

Scalability, performance, and security to defend critical assets

Powered by an intelligent global network

Cloudflare for Government is our suite of services for US government and public sector agencies, delivered from our global, highly resilient cloud network with built-in security and performance.

What can agencies accomplish with Cloudflare?

- Build fast, reliable, and scalable services
- Deliver unified, layered security across all endpoints, users, and clouds
- Reduce complexity, risk and cost
- Add or remove services as needed
- Consolidate vendors and tools to reduce complexity and risk
- Address evolving needs with a security platform that keeps up with changes

Largest global FedRAMP Authorized network

Cloudflare partners with leading United States federal, state, and local government agencies to deliver secure, resilient, available, and compliant digital citizen services. Cloudflare for Government is a FedRAMP Moderate authorized cloud service provider.

One network, everywhere

The Cloudflare network runs every service on every server in every data center, with no tradeoffs between security and performance. Your services will be more resilient, easier to deploy and manage, and adaptable to evolving technical requirements.

Built-in security and compliance

Cloudflare blocks an average of 140 billion threats per day, including some of the largest DDoS attacks ever recorded. Cloudflare's network is built with data protection and compliance in mind, with end-to-end encryption and solutions for data locality and storage.

Resilient and future-proof

Cloudflare improves the performance and reliability of any Internet-connected application or service. You can build your services on a uniform and composable platform for easy setup and operations without the cost or complexity of legacy network hardware.
Protect agency employees, applications, and networks

“With the Cloudflare platform, we’re getting very high-powered, very technical cybersecurity detection and protections that take little to no effort to deploy. That’s especially poignant when we’re talking about vulnerable organizations that already struggle with resources, let alone managing another complicated tool.”
