

Cloudflare Network Interconnect

Directly connect your networks to Cloudflare

Simplify how you connect to Cloudflare

Improve the performance and security of your network infrastructure in the time it takes to make coffee

Cloudflare Network Interconnect (CNI) allows you to connect your network infrastructure directly with Cloudflare – rather than using the public Internet – for a more reliable and secure experience. With CNI, you can bring Cloudflare’s full suite of network functions to your physical network edge.

CNI can provide enhanced capabilities when paired with:

- **CDN:** Improve cache fill performance
- **Magic Transit:** Deliver clean traffic over secure and private connections
- **Magic WAN:** Improve performance and avoid backhauling

Figure 1: Connectivity Cloud

We have never charged for CNIs

Cloudflare is committed to continue making it even easier for customers to connect to Cloudflare and destinations on the Internet

Better Performance

With no intermediary transit providers and associated hops between Cloudflare and your network, you get faster performance

More secure

Each connection is reserved exclusively for the customer that provisions it — ensuring customer traffic is isolated and private

Lower costs

Customers can benefit from reduced Internet Service Provider bandwidth costs, data transfer costs and interconnection related costs
