CLOUDFLARE

DATA SHEET

Cloudflare Security Center

Identify and mitigate security risks across your Cloudflare instance

Attackers constantly scan enterprise attack surfaces - the hardware, software, SaaS, and cloud assets accessible from the Internet, looking for ways to gain access or steal data.

Organizations are challenged with keeping pace with shifting attack surface risk, and often attempt to do so through manual, in-house efforts or expensive, hard-to-manage products.

Cloudflare Security Center offers a suite of tools to mitigate security risk - all integrated in the Cloudflare dashboard.

Centralized security insights

Security Center maps your attack surface, including a view of Cloudflare IT inventory, and a prioritized listing of security risks, potential misconfigurations, and vulnerabilities within your Cloudflare account.

Infrastructure

Infrastructure offers a centralized summary of all domains, ASNs, and IPs being used as IT infrastructure by an organization, with detail on domains proxied by Cloudflare or protected by Cloudflare Access.

Security Insights

Review issues, with the ability to filter by issue type, severity, category or zone, including checks examining compliance, insecure configurations, exposed infrastructure and infrastructure expiry.

Investigate

Better scrutinize and respond to threats by querying data gathered from the Cloudflare network (IP, ASN, URLs, files, etc.) using Investigate, a dedicated threat investigations platform.

Recommended mitigations

Put security insights into action by following recommended mitigation actions, linking directly to relevant Cloudflare configuration/settings for immediate risk education.
