

Cloudflare for Public Sector

Enable seamless experiences for citizen services

Achieve critical strategic priorities

Deploy resilient and secure public services

Federal, state, and local government agencies are tasked with delivering best-in-class citizen services while facing dramatic increases in traffic and an increase in cyber attacks. At the same time, many employees and contractors work from the office and from home, putting strain on legacy IT systems and presenting new security risks. As workstreams shift to the cloud, agencies need to reduce costs and complexity by modernizing and consolidating legacy systems into new hybrid, multi-cloud architectures.

Cloudflare helps public sector agencies simplify application access for their employees and contractors, distribute and protect critical infrastructure and applications, apply consistent Zero Trust-based policies, and enhance citizen services with modern digital experiences.

Better citizen services

Users and employees get the benefit of improved productivity through a consistent, low-latency experience when accessing public and internal resources.

Easier administration

The Cloudflare platform has a uniform and composable architecture for easy setup and operations, reducing administrative burdens and IT costs.

Improved efficiency

Administrators can rapidly adjust to new threats, evolving markets, and organizational changes across networking and security teams with a single unified control plane.
